PROFESSIONAL SUMMARY

Full-Stack Developer who designs, builds and ships production systems end to end: data models, APIs and background workers, web and Android front-ends, and the infrastructure they run on. Since 2024, working solo from requirements to handover for organizations and small businesses with no in-house engineering team, integrating third-party platforms and deploying to self-hosted and cloud infrastructure. Core stack: TypeScript, Node.js, React/Next.js, PostgreSQL, Docker and Kotlin. Every system ships with runbooks and guides that non-technical staff use to run it. Professional working proficiency in English; available during US and European business hours.

TECHNICAL SKILLS

Development Practices: Systems Design, Software Architecture, REST API Design, Database Modeling, Monorepo Architecture, Third-Party API Integration, Data-Privacy Compliance (LGPD), Production Debugging, Technical Documentation

Languages: TypeScript, JavaScript, SQL, Python, Kotlin, Bash, HTML5, CSS3

Backend & Data: Node.js, Fastify, REST APIs, Zod, PostgreSQL, TimescaleDB, Redis, BullMQ, Supabase (RLS, Edge Functions, Realtime, pg_cron), Neon

Frontend & Clients: React, Next.js (App Router), Astro, Vite, Tailwind CSS, Zustand, React Native (Expo), Capacitor, Android (Kotlin, Room, WorkManager), NW.js

Integrations & Automation: WhatsApp Business Cloud API, Chatwoot, n8n, Google Android Management API, Cloud Pub/Sub, Mercado Pago Pix, Stripe, Webhooks, Steamworks

Infrastructure & DevOps: Docker Compose, Linux, Nginx, TLS/Let's Encrypt, Cloudflare, S3-Compatible Storage, AWS, Google Cloud (GCP), GitHub Actions, CI/CD, Vercel, Backup & Restore Automation

Security: Auth0, JWT with Refresh-Token Rotation, RBAC, Row-Level Security, HMAC/OIDC Webhook Verification, Rate Limiting, Audit Logging

AI-Assisted Development: Claude Code, Claude API, Gemini, Local LLMs, Spec-Driven Development

EXPERIENCE

Full-Stack Developer

Feb 2026 – Present

Pública Assessoria em Gestão Empresarial Ltda · Contract · Brasília, Brazil (Hybrid)

A consultancy with no in-house engineering team needed software built to order as well as the day-to-day IT its operation runs on, and brought in a single developer to own both end to end. Everything produced under this contract is confidential and owned by the client, so it is described here in general terms only.

- Took every request from requirements through launch, training and support — modelling the data, building the APIs and background processing, the web and mobile front-ends and the servers they run on — so the company ships and evolves its internal tools without an engineering team of its own.
- Turned operational needs from non-technical stakeholders into specifications and delivery plans as the single technical point of contact, closing the gap between what was asked for and what was delivered.
- Applied privacy-by-design and LGPD practices, access control, backup and recovery routines and automated checks in the delivery pipeline, so each system goes live with its compliance and recovery story already settled rather than retrofitted.
- Wrote operator and IT documentation for every delivery, so staff run the systems day to day without developer support.

Full-Stack Developer

Nov 2024 – Present

Self-Employed · Freelance · Remote

Small businesses and independent professionals need complete software but have no engineering staff to build or maintain it. Each project is taken on solo, owning every layer — database, APIs, frontend and deployment — from the first requirements through post-launch support.

Barbearia Tech — White-Label Booking Platform · Next.js 16 · React 19 · Neon Postgres · Vercel

- Built a config-driven white-label architecture in which one brand file controls branding, locations, services, staff and payment methods, so onboarding a new barbershop is a config change instead of a new build.
- Delivered a 4-step booking flow backed by server-side availability per barber and timezone-aware scheduling, so customers only ever see slots that are genuinely free and double bookings stop reaching the shop.
- Added a role-scoped staff dashboard behind HMAC-signed sessions, so owners read revenue, average ticket and cancellations while each barber sees only their own schedule.
- Kept the payment layer provider-agnostic across Pix and card, so a real payment provider can be connected without touching the booking flow.

SELECTED PROJECTS

Mana Realm — Cross-Platform Desktop & Browser Game

Oct 2025 – Present

JavaScript · HTML5 Canvas · NW.js · Steamworks · GitHub Actions · Vercel · manarealm.vercel.app

A solo-built action game that had to reach the browser and the desktop stores from a single codebase, and stay playable on modest hardware, with no team to split the engine, tooling and release work across.

- Ships one vanilla-JS codebase to the web and to 4 desktop targets (Windows, Linux, macOS arm64/x64) through a GitHub Actions native-runner build matrix, and isolated Steam integration in a helper process to work around a crash when the desktop runtime loads native modules — so every platform ships from the same source with no separate desktop port to maintain.
- Profiled rendering with the Chrome DevTools Protocol and rebuilt the hot path around a zero-allocation frame loop, spatial hashing and adaptive quality tiers, cutting GPU fill by **60%**, texture memory by **63%** and HUD raster time from 11.9 to 4.5 ms.
- Wrote a custom verification suite of ~500 checks over balance data, asset integrity and localization, so a release in 6 languages goes out without a manual regression pass.

EDUCATION

Associate Degree — Systems Analysis and Development · Senac · 2024
